

# Create AirNowTomed git Submodule

## INTRODUCTION

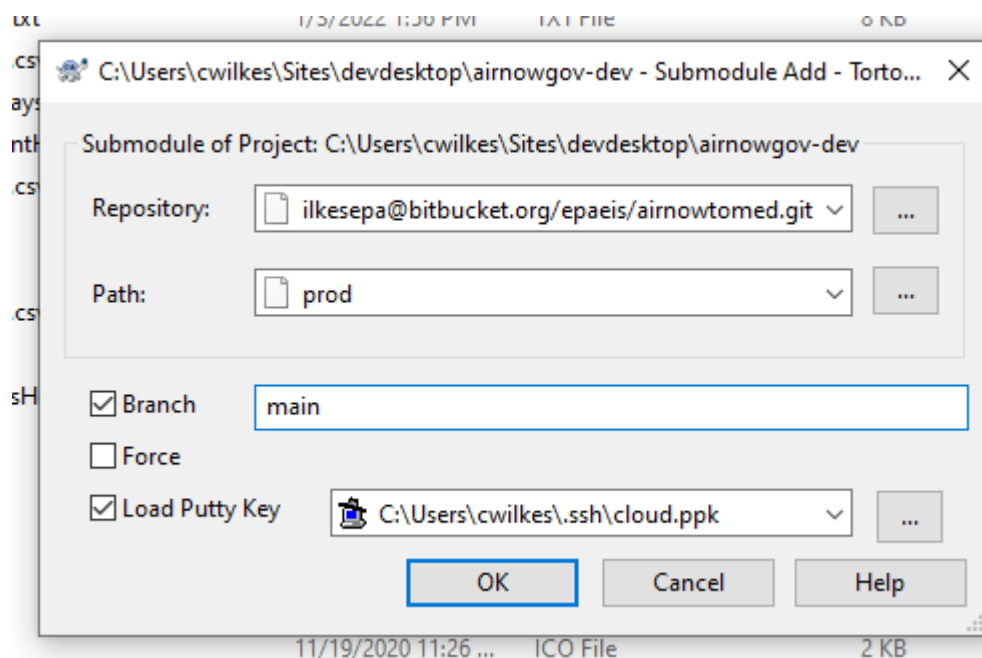

Use this procedure to build a git Submodule for the post TOMEd HTML used on cloud.gov. Each time we TOME we will git push the changes into a Bit Bucket repository so that anyone can git pull the HTML and do their own cf push to cloud.gov

This procedure assumes that you are using DevDesktop and wish to build the AirNowTomed repository as a submodule inside your existing airnowgov-dev repository. You can view the Bit Bucket repository's files here:

<https://bitbucket.org/epaeis/airnowtomed/src/main/>

## PROCEDURE

1. Delete your existing "prod" directory which should be a path like this:
  - a. C:\Users\<user>\Sites\devdesktop\airnowgov-dev
2. Use Tortoise git to create a Submodule *inside* your existing "Dev Cloud" repository.
  - a. Repository = <https://<bitbucketID>@bitbucket.org/epaeis/airnowtomed.git>
  - b. Path = prod
  - c. Branch = main
  - d. Load Putty Key = path & file to your Private key

3. Enter your Private key password.
4. Enter your Bit Bucket ID password.
5. Verify by making a trivial change. Commit and Push that change and verify it on the web at:
  - a. <https://bitbucket.org/epaeis/airnowtomed/src/main/>
